

The Art, Science, and Engineering of Programming

Preparing Articles for Programming

Tobias Pape^a, Cristina V. Lopes^b, and Robert Hirschfeld^a

a Hasso Plattner Institute, University of Potsdam, Germany

b University of California, Irvine, USA

Abstract Many academic journals and conferences exist that publish research related to programming, starting with programming languages, software engineering, and expanding to the whole Computer Science field. Yet, many of us feel that, as the field of Computer Science expanded, programming, in itself, has been neglected to a secondary role not worthy of scholarly attention.

We posit that a scholarly journal focusing primarily on programming will help close this gap, and foster a more meaningful bridge between research and the practice of software development.

The Art, Science, and Engineering of Programming accepts papers under several perspectives: the art itself (programming styles, pearls, models, languages), the emerging science of understanding what works and what doesn't work in general and in specific contexts, as well as more established engineering and mathematical perspectives.

This journal aims at placing the wonderful art of programming in the map of scholarly works.

We present this short paper as an example of, and a guide to, writing articles for The Art, Science, and Engineering of Programming journal. The complete template is provided: the class file (programming.cls), an example paper (example-programming.tex, this file), and an example bibliography file (example.bib).

Much of the progress in Computer Science lies on the basis of computer programs, the people who write them, and the concepts and tools available to them to express computational tasks. The existence of a journal focusing on programming is of utmost importance for strengthening our understanding of these activities.

Preparing Articles for Programming

1 A Guided Tour

The content of a paper is its most important ingredient. That being said, papers for The Art, Science, and Engineering of Programming should adhere to a common style, which is achieved with the programming LaTeX class. You are to use this class as outlined here when submitting articles to the journal. This document acts as an example of what this can look like and a short references for all its parts.

1.1 Document Parts

We have included a most minimal article in listing 1 that you can adapt to the concrete work to be submitted. First, you have to select the programming class as in line 1. The parameter `english` is for language selection (optional, but recommended). The other parameter, `submission`, is crucial for the reviewing process and must be included for submission. More information on document parameters can be found in section 5.1. After that, we recommend that you load the `biblatex` package. While it is perfectly fine to use plain BibTeX, we recommend `biblatex`, as it has native Unicode support and can handle `URLS` and `DOIS` better. In both cases, we have preloaded a bibliography style.

At that point, you can load necessary LaTeX packages. We already load some important packages with the programming class and that there are certain packages that are not recommended or incompatible with this class. Refer to section 5.6 for which packages are recommended. Then you start the document with `\begin{document}`.

You have to provide details to your submission that will be used during the review process. For that, use the `paperdetails` command and specify *perspective* and *area* of your submission. For perspective, choose from one of the *Art*, *theoretical* or *empirical Science*, or *Engineering* and provide it as argument to the `perspective` keyword; they can be found in section 2.1. For area, specify an argument to the `area` keyword (in braces). Find a list of suggested areas in section 2.2.

We need you to provide certain metadata which you can do with the following commands, as form line 12. You can specify the title and maybe the subtitle with `\title` (and `\subtitle`, respectively). Then please list all authors. For that, use one `\author` command per author and give an affiliation for each with `\affiliation`. When several consecutive authors share the same affiliation, you should only use one `\affiliation` command after the last of them. More information can be found in section 5.2.

Please include one to five keywords, separated by commas, that are important to your work with the `\keywords` command as in line 18. We kindly ask you to classify your work using the *ACM Computing Classification System*.¹ Please visit the ACM's website and generate the TeX code that matches your classification. The code should consist of a `CCSXML` environment and several `\ccsdesc` commands, as in lines 20 to 30.

```

Preparing Articles for Programming

With `\maketitle` and the `abstract` environment, you can produce the article’s title page. Then you can start with your content. If applicable, you can put acknowledgements at the end after an `\acks` command, as in line 42.

1.2 Running LaTeX

This class has been tested with the popular LaTeX programs available. It should work with pdfLaTeX, LuaLaTeX, and XeLaTeX. We suggest that you use LuaLaTeX, which is included in all major TeX system installations, has a good Unicode support, and is well portable. Please do not use the LaTeX/dvips combination to produce output files. To get all metadata right, several LaTeX runs will be necessary. Hence, a typical run looks like this:

```
1 lualatex myarticle
2 biber myarticle
3 lualatex myarticle
4 lualatex myarticle
```

You should replace `lualatex` with the LaTeX program of your choice, and `biber` with `bibtex` if you do not want to use Biblalex (or use Biblalex’s BibTeX backend).

Your PDF file for your article should then be ready for submission.

2 Submission Classification

Almost anything about programming is in scope for The Art, Science, and Engineering of Programming. However, you should classify your article according to the following aspects.

2.1 Perspective

We accept descriptions of work under different perspectives:

The Art. This perspective is about knowledge and technical skills acquired through practice and personal experiences. Examples include libraries, frameworks, languages, APIs, programming models and styles, programming pearls, and essays about programming.

Science (theoretical). This perspective is about knowledge and technical skills acquired through mathematical formalisms. Examples include formal programming models and proofs.

Science (empirical). This perspective is about knowledge and technical skills acquired through experiments and systematic observations. Examples include user studies and programming-related data mining.

Engineering. This perspective is about knowledge and technical skills acquired through designing and building large systems and through calculated application of principles in building those systems. Examples include measurements of artifacts’ properties, development processes and tools, and quality assurance methods.

To classify your work as any of the above perspectives, please set the perspective keyword of the `\paperdetails` command to one of the following values:

art for submissions concerning *The Art* (`theart` is a proper alias);

sciencetheoretical For submissions concerning *Science (theoretical)*, with the aliases `sciencetheoretical`, `theoreticalscience`, `theoretical`, `science-theoretical`, and finally `theoretical-science`;

scienceempirical for submissions concerning *Science (empirical)*, the valid aliases are `scienceempirical`, `empiricalscience`, `empirical`, `science-empirical`, and `empirical-science`; and

engineering for submissions concerning *Engineering*.

2.2 Area of Submission

Independent of the type of work, the journal accepts submissions covering several expertise areas. Expertise areas include, but are not limited to:

- General-purpose programming
- Distributed systems programming
- Parallel and multi-core programming
- Graphics and GPU programming
- Security programming
- User interface programming
- Database programming
- Visual and live programming
- Data mining and machine learning programming, and for programming
- Interpreters, virtual machines and compilers
- Modeling and modularity
- Testing and debugging
- Program verification
- Programming education
- Programming environments
- Social coding

To specify the area of expertise for your work, please set the area keyword of the `\paperdetails` command to one of the preceding suggested areas, or provide your own. Please use curly braces `{}` around the value.

3 Choice of License (optional)

All work published by The Art, Science, and Engineering of Programming will be available as open-access. Therefore, authors submitting a paper to The Art, Science,

Preparing Articles for Programming

and Engineering of Programming should grant a Creative Commons license. We support two licenses (description adapted from Wikipedia²):

 Attribution 4.0 CC BY 4.0

Licensees may copy, distribute, display and perform the work and make derivative works and remixes based on it only if they give the author or licensor the credits (attribution) in the manner specified by these.

 Attribution-NonCommercial 4.0 CC BY-NC 4.0

Licensees may copy, distribute, display and perform the work and make derivative works and remixes based on it only if they give the author or licensor the credits (attribution) in the manner specified by these and only for non-commercial purposes.

To choose a license for your work, set the license keyword of the `\paperdetails` command to either `cc-by` or `cc-by-nc`. Please be aware that, in absence of a choice, we assume `cc BY`.

4 Typographical and Technical Aspects

We have carefully chosen the presentation for articles published in The Art, Science, and Engineering of Programming to fit on-screen reading and occasional printouts. It is important to maintain a uniform look of all articles appearing in the journal. We kindly ask you therefore to *not* change the presentation. Most importantly,

- please do not change the font or the font size for that matter. The text font remains fixed as *Charter* (in the XCharter variant) and emphasis font is *Fira Sans*. The only exception is the typewriter font, where you can choose from two variants (please refer to paragraph 5.1). Moreover;
- please do not change the margins or the line spacing;
- please refrain from using the `\sloppy` command, especially for the whole document;
- please avoid the use of the `[H]` or `[h!]` modifiers for figures, tables, and similar elements;
- please use a consistent formatting (for example, use the `siunitx` package [6]).

This class has been tested on several LaTeX systems. We suggest that you use an up-to-date system, for example TeXLive,³ which is available for Linux, Windows, and Apple systems, among others. We tested with the 2015 and 2016 systems and will make sure that it will work with upcoming systems, too. Please first upgrade your system if problems with this class should occur. Regarding the LaTeX system, please keep in mind to

- use LaTeX packages only if required, as fewer packages lower the chance of conflicts (refer to section 5.6 for details);

² https://en.wikipedia.org/w/index.php?title=Creative_Commons_license&oldid=754498632

³ <https://www.tug.org/texlive/>.

- keep the use of custom macros low to not interfere with provided packages and use LaTeX commands to do so (for example, `\newcommand` and similar instead of TeX's `\def`);
- watch out for unsuitable line- and pagebreaks;
- when using pixel graphics, provide at least 300 dpi imagery, PDF files preferred;
- minimize the use of LaTeX comments, especially via block constructs;
- consult the *l2tabu* documentation [5] about outdated packages;
- provide DOIS for all your references, unless inaccessible.

We suggest the use of a spellchecker to avoid typos.

Please note that all article source must be UTF-8 encoded, no exceptions.

5 Detailed Reference

Several aspects of this class as outlined above provide for some fine tuning.

5.1 Class Options

As explained in section 1, submissions to the journal must use the submission package option. For the accepted final, to-be-published version, this option should be omitted or replaced by `crc` for “Camera-ready Copy”. Actually, both are shortcuts for the `phase` keyword, which could be used, instead. Hence, the following statements in either column are equivalent:

	<i>Final phase</i>	<i>Submission phase</i>
1	<code>\documentclass[phase=final]{programming}</code>	<code>\documentclass[phase=submission]{programming}</code>
2	<code>\documentclass[crc]{programming}</code>	<code>\documentclass[submission]{programming}</code>
3	<code>\documentclass{programming}</code>	

Code Fonts The standard font for code, as selected with `\texttt`, `\ttfamily`, or a listing, is set to be the same as the sans serif font, *Fira Sans*. This matches the rest of the document style very well. However, it may be strictly necessary to have a non-proportional (or monospaced) font for the typewriter style. We therefore provide a class option code to change the typewriter font. It takes one the following values:

code=sf Sets the code font to the sans serif font (Fira Sans). This is the default. Aliases for this option are `code=sans` and `code=sansserif`.

code=tt Sets the code font to Fira Sans’ monospaced equivalent, Fira Mono. Aliases for this option are `code=mono` and `code=monospace`. This is the preferred choice if monospaced typewriter font is necessary. Note that this font does not have italics.

Other Options All other options give in the `\documentclass` command are not processed directly by the class but rather passed on to other packages as “global options”. For example, the `english` option from the example above does not influence the programming class directly, but rather will be picked up by Babel [2] to set up language options.

Preparing Articles for Programming

5.2 Document Metadata

The presentation of the document metadata can be fine tuned, as well. Besides the `\title` and `\subtitle` commands, there is the `\titlerunning` command to specify a shorter title when the normal title does not fit into the page header. Similarly, the `\authorrunning` command can be used to specify the presentation of the authors in the header.

Sometimes listing the affiliations of the authors can be tricky when they are shared. An optional argument to the `\author` and `\affiliation` command can be used to associate authors and affiliations explicitly. Four variants for affiliations are outlined in the beginning of listing 2.

For the final publication, we ask you to provide a short information of each author, typically a very short biography, and a photo. You can use the `\authorinfo` command right after an `\author` command to associate that author information with an author. See line 27 in listing 2 for example. The photo is given as optional argument as file name in brackets (without file extension). Omitting the photo will produce a blank space next to the author information. The actual information follows as an argument. Note that the author's *name* is prepended to the information automatically and is not to be repeated.

An author's email address can be given in either the affiliation or author information block. Please use the `\email` command for that purpose.

5.3 Paper Details

Besides specifying the perspective and area of the submission, the `\paperdetails` command is also used to provide publication information for the final, camera-ready-copy phase (class option `phase=final`). In this case, perspective and area are removed from the title page and the Digital Object Identifier (DOI), as well as the dates of submission and publications are presented instead. The information necessary for this is provided *by the publisher* after acceptance. It includes the following information:

year The year of the articles publication.

volume The volume the article appears in.

issue The issue the article appears in.

articlenumber The number of the article within the volume.

submitted The date the article was submitted to (and received by) the publisher.

Please use an ISO date (YYYY-MM-DD).

published The date the article was published and made public by the publisher. Please use an ISO date (YYYY-MM-DD).

See the end of listing 2 for an example.

5.4 Figures, Tables, Listings

Sometimes it is necessary to pay special attention to the *floating elements* of your document, that is figures, tables, listings, and similar. While it is tempting to force those elements to the specific position where they are written down, this is not always

■ **Listing 2** Four ways to specify affiliations / Author information example / Sample publication paper details

Implementation	yes	1.2×10^{-3}	m ² /s
Evaluation	no		
Related Work	no		
Conclusion	yes	4955.3	/kg

^a Just a few things missing

the best choice, especially since it can interrupt the reading flow. Therefore please refrain from using the [h!] and [H] specifiers for such elements. If you *must* have the element at the current position, it maybe is not a *floating element*, in the first place. It is perfectly fine to use graphics *without* a `\begin{figure}...\end{figure}` environment or use a `\begin{tabular}...\end{tabular}` *without* an enclosing `\begin{table}...\end{table}`.

The caption position of a floating element should match its content. For tables, listings, algorithms, or similar list-like content, please use captions *above* its contents, as those elements are typically read from top to bottom. Find examples in the listings already presented and table 1. For figures, graphs, graphics, or similar, please use captions *below* the imagery, as in figure 1.

For tabular content, we suggest to avoid vertical lines altogether and keep horizontal lines to a minimum. Refer to the booktabs package documentation for more information [3]. Also, the threeparttable package is valuable if you need footnotes in your table [1].

5.5 Bibliography

As outlined, the programming class supports both plain BibTeX as well as the newer BibLaTeX bibliography package to present your references. Please note that you may not change the bibliography style, it is pre-selected by the class. It is a simple, numbered style with all references sorted alphabetically. In text, it should look like this: [4]. Note that the reference has the DOI included. We would like to encourage you to always provide the DOIs of the works you cite, if possible. However, please make sure in your

■ **Figure 1** A test figure

■ **Listing 3** A typical BibTeX entry for [4]

```

1 @article{DBLP:journals/cacm/Knuth74,
2   Author = {Donald E. Knuth},
3   Doi = {10.1145/361604.361612},
4   Journal = {Communications of the {ACM}},
5   Number = {12},
6   Pages = {667--673},
7   Title = {{Computer Programming as an Art}},
8   Volume = {17},
9   Year = {1974}}

```

bibliography file, that the doi entry is a plain entry without a “resolver” (for example, <http://dx.doi.org/>) prepended. A typical example for an entry format should look like in listing 3. Please shorten neither names nor journal articles, if possible.

The bibliography commands for your article should look like this (for Biblatex and plain BibTeX, respectively):

Biblatex

```

1 \documentclass{programming}
2 \usepackage[backend=biber]{biblatex}
3 \addbibresource{example.bib}
4 \begin{document}
5 ...
6 \printbibliography
7 \end{document}

```

Plain BibTeX

```

\documentclass{programming}

\begin{document}
...
\bibliography{example}
\end{document}

```

5.6 LaTeX Packages Considerations

The following packages are automatically loaded by the programming class and need not to be loaded manually.

- `accsupp`
- `amsmath`
- `amstext`
- `array`
- `atbegshi`
- `babel`
- `booktabs`
- `calc`
- `caption`
- `colortbl`
- `comment`
- `csquotes`
- `doclicense`
- `expl3`
- `FiraSans`
- `fnpct`
- `fontspec`
- `fontenc`
- `getttitlestring`
- `graphics`
- `graphicx`
- `grfext`
- `hypcap`
- `hyperref`
- `hyperxmp`
- `listings`
- `mathdesign`
- `microtype`
- `morewrites`
- `multirow`
- `relsize`
- `rotating`
- `siunitx`
- `subcaption`
- `tabularx`
- `textcase`
- `textcomp`
- `threeparttable`
- `typearea`
- `url`
- `verbatim`
- `xcolor`
- `xparse`
- `xspace`
- `xunicode`

The following packages *must not* be loaded.

Preparing Articles for Programming

- `Slstyle`
- `Slunits`
- `a4wide`
- `a4`
- `aecompl`
- `ae`
- `caption2`
- `courier`
- `doublespace`
- `epsfig`
- `epsf`
- `euler`
- `fancyhdr`
- `fancyheadings`
- `fourier`
- `geometry`
- `glossary`
- `helvet`
- `isolatin`
- `mathpple`
- `mathptmx`
- `mathptm`
- `newtxmath`
- `newtxtext`
- `palatino`
- `psfig`
- `pslatex`
- `scrpage`
- `subfigure`
- `subfig`
- `t1enc`
- `times`
- `umlaut`
- `utopia`
- `zefonts`

Additionally, any package that changes the font must not be loaded.

Acknowledgements We want to thank you for using this class to prepare articles for The Art, Science, and Engineering of Programming.

A A Famous Filler Text

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit in voluptate velit esse cillum dolore eu fugiat nulla pariatur. Excepteur sint occaecat cupidatat non proident, sunt in culpa qui officia deserunt mollit anim id est laborum.

B Submission Checklist

- All authors are listed, with affiliation
- The abstract is not longer than 500 words.
- The abstract states, in this order, *Context*, *Inquiry*, *Approach*, *Knowledge*, *Grounding*, and *Importance* of the submission.
- The ACM CCS 2012 classification is included.
- A list of relevant keywords is provided.
- One *perspective* has been chosen.
- One or more *area(s) of submission* have been chosen.
- The license has been acknowledged or changed to fit.
- The title page does not spill onto the second page.
- The running title on even pages' heads is not wider than the text block.
- The running list of author on odd pages' heads is not wider than the text block.
- The only text encoding used is UTF-8.
- The fonts, margins, and spacings are unchanged.
- All URLs are marked using the `\url` command.
- All units are separated from their values with a half space, consistently (see [6]).
- Bold font is not used (or only in exceptional circumstances).

- Underlining is not used (no exceptions).
 - Bold or bright colors are only ever used sparingly.
 - The captions of (a) tables, (b) listings, and (c) algorithms are *above* the content, flush left.
 - The captions of (a) figures, (b) charts, (c) combined content, and similar are *below* the content, flush left.
 - Tables adhere to best practice layout [3]. Yes

a	b
x	abc
y	def

No

a	b
x	abc
y	def
 - They do not contain vertical lines and only few horizontal lines.
 - All fonts are embedded. This includes the fonts for any included (PDF-)graphics.
 - All graphics are either vector graphics or have at least 300 dpi.
 - Acknowledgements, including statement of funding bodies or projects, is placed before the references, using the `\acks` command.
 - Citations in the text are preceded by a non-breaking space. (→ Citations do not appear at the beginning of a line)
 - The bibliography lists all cited works, all authors are given (no *et. al.*), the full names of the authors are used.
 - All bibliography entries have a DOI (unless not applicable, such as for slides or unpublished work).
 - All bibliography entries show an ISBN, if they have one assigned.
 - All bibliography entries that represent web sites have a URL and an *access date*.
 - No bibliography entries have duplicate information in URL and DOI.
- For the final phase (or camera-ready copy), additionally:
- The `\paperdetails` are included as provided by the journal.
 - The DOI, and submission and publication date appear on the title page.
 - Neither the *perspective* nor the *area of submission* appear on the title.
